THEORETICAL PEARLS

A Simple Proof of a Folklore Theorem about Delimited Control

Abstract

We formalize and prove the folklore theorem that the static delimited-control operators \textit{shift} and \textit{reset} can be simulated in terms of the dynamic delimited-control operators \textit{control} and \textit{prompt}. The proof is based on small-step operational semantics.

1 Introduction

In the recent upsurge of interest in delimited continuations (Ariola \textit{et al.}, 2004; Dybvig \textit{et al.}, 2005; Gasbichler & Sperber, 2002; Shan, 2004; Kiselyov, 2005) it appears to be taken for granted that dynamic delimited continuations can simulate static delimited continuations by delimiting the context of their resumption. And indeed this property has been mentioned early in the literature about delimited continuations (Danvy & Filinski, 1990, Section 5). We are, however, not aware of any proof of this folklore theorem, and our goal here is to provide such a proof. To this end, we present two abstract machines—one for static delimited continuations as provided by the control operators \textit{shift} and \textit{reset} (Danvy & Filinski, 1990) and inducing a partial evaluation function \textit{eval}_{sr}, and one for dynamic delimited continuations as provided by the control operators \textit{control} and \textit{prompt} (Felleisen \textit{et al.}, 1988) and inducing a partial evaluation function \textit{eval}_{cp}—and one compositional mapping \([\cdot]_{sr}\) from programs using \textit{shift} and \textit{reset} to programs using \textit{control} and \textit{prompt}. We then prove that the following diagram commutes:

\[
\begin{array}{ccc}
\text{Exp}_{sr} & \xrightarrow{\text{eval}_{sr}} & \text{Val}_{sr} \\
[\cdot]_{sr} & \downarrow & \downarrow \\
\text{Exp}_{cp} & \xrightarrow{\text{eval}_{cp}} & \text{Val}_{cp}
\end{array}
\]

where the value equivalence $\simeq_v$, for ground values, is defined as equality.

2 The formalization

Figures 1 and 2 display two abstract machines, one for the $\lambda$-calculus extended with shift and reset, and one for the $\lambda$-calculus extended with control and prompt. These two machines only differ in the application of captured contexts (which represent delimited continuations in the course of executing source programs).

For simplicity, in the source syntax, we distinguish between $\lambda$-bound variables ($x$) and shift- or control-bound variables ($k$). We use the same meta-variables ($e, n, i, x, k, v, p, C_1$ and $C_2$) ranging over the components of the two abstract machines whenever it does not lead to ambiguity. Programs are closed terms.

2.1 A definitional abstract machine for shift and reset

In our earlier work (Biernacka et al., 2005), we derived a definitional abstract machine for shift and reset by defunctionalizing the continuation and meta-continuation of Danvy and Filinski’s definitional evaluator (Danvy & Filinski, 1990). This definitional abstract machine is displayed in Figure 1; it is a straightforward extension of Felleisen et al.’s CEK machine (Felleisen & Friedman, 1986) with a meta-context. The source language is the untyped $\lambda$-calculus extended with integers, the successor function, shift (noted $S$), and reset (noted $\lfloor \rfloor$). The machine is an extension of the CEK machine because when given a program that does not use shift and reset, it operates in lock step with the CEK machine. When delimiting control with reset, the machine pushes the current context on the current meta-context, and proceeds with an empty context. When abstracting control with shift, the machine captures the current context and proceeds with an empty context. When applying a captured context, the machine pushes the current context on the current meta-context, and proceeds with the captured context.

Definition 1

The partial evaluation function $\text{eval}_{sr}$ mapping programs to values is defined as follows:

$$\text{eval}_{sr} (e) = v \text{ if and only if } \langle e, \rho_{mt}, \text{END}, \text{nil} \rangle \text{eval} \Rightarrow^*_{sr} \langle \text{nil}, v \rangle_{\text{cont}_2}.$$ 

We could define the function $\text{eval}_{sr}$ in terms of the initial and final transition, but they play only an administrative role, i.e., to load an input term to the machine and to unload the computed value from the machine.

2.2 A definitional abstract machine for control and prompt

In our earlier work (Biernacka et al., 2005), we also showed how to modify the abstract machine for shift and reset to obtain a definitional abstract machine for control and prompt (Felleisen et al., 1988; Felleisen, 1988). This abstract machine is displayed in Figure 2. The source language is the $\lambda$-calculus extended with integers, the successor function, control (noted $F$) and prompt (noted $\#$). The machine is an extension of the CEK machine because when given a program that does not use control and prompt, it operates in lock step with the CEK machine. When delimiting control with prompt, the machine pushes the current context on the current meta-context, and proceeds with an empty context. When abstracting control with control, the machine captures the current
• Terms and identifiers: \( e ::= \bar{n} \mid i \mid \lambda x.e \mid e_0.e_1 \mid \text{succ} \ e \mid \langle \rangle \mid Sk.e \)

\( i ::= x \mid k \)

• Values (integers, closures, and captured contexts): \( v ::= n \mid [x, e, \rho] \mid C_1 \)

• Environments: \( \rho ::= \rho_{nc} \mid \rho[i \mapsto v] \)

• Contexts: \( C_1 ::= \text{END} \mid \text{ARG} \((e, \rho), C_1) \mid \text{FUN} \((v, C_1) \mid \text{SUCC} \((C_1) \)

• Meta-contexts: \( C_2 ::= \text{nil} \mid C_1 :: C_2 \)

• Initial transition, transition rules, and final transition:

\[
\begin{align*}
e &\Rightarrow \langle e, \rho_{nc}, \text{END}, \text{nil}\rangle_{eval} \\
\langle \bar{n}, \rho, C_1, C_2\rangle_{eval} &\Rightarrow \langle C_1, n, C_2\rangle_{cont_1} \\
\langle i, \rho, C_1, C_2\rangle_{eval} &\Rightarrow \langle C_1, \rho(i), C_2\rangle_{cont_1} \\
\langle \lambda x.e, \rho, C_1, C_2\rangle_{eval} &\Rightarrow \langle C_1, \langle x, e, \rho\rangle, C_2\rangle_{cont_1} \\
\langle e_0.e_1, \rho, C_1, C_2\rangle_{eval} &\Rightarrow \langle C_0, \rho[e_0 \mapsto \langle e_1, \rho\rangle, C_1], C_2\rangle_{eval} \\
\langle \text{succ} \ e, \rho, C_1, C_2\rangle_{eval} &\Rightarrow \langle e, \rho, \text{SUCC} \((C_1), C_2\rangle_{eval} \\
\langle \langle \rangle, \rho, C_1, C_2\rangle_{eval} &\Rightarrow \langle e, \rho, \text{END,} C_1 :: C_2\rangle_{eval} \\
\langle Sk.e, \rho, C_1, C_2\rangle_{eval} &\Rightarrow \langle e, \rho[k \mapsto C_1], \text{END,} C_2\rangle_{eval} \\
\langle \text{END,} v, C_2\rangle_{cont_1} &\Rightarrow \langle C_2, v\rangle_{cont_2} \\
\langle \text{ARG} \((e, \rho), C_1), v, C_2\rangle_{cont_1} &\Rightarrow \langle e, \rho, \text{FUN} \((v, C_1), C_2\rangle_{eval} \\
\langle \text{FUN} \((x, e, \rho), C_1), v, C_2\rangle_{cont_1} &\Rightarrow \langle e, \rho[x \mapsto v], C_1, C_2\rangle_{eval} \\
\langle \text{FUN} \((C_1), v, C_2\rangle_{cont_1} &\Rightarrow \langle C_0, v, C_1 :: C_2\rangle_{cont_1} \\
\langle \text{SUCC} \((C_1), n, C_2\rangle_{cont_1} &\Rightarrow \langle C_1, n + 1, C_2\rangle_{cont_1} \\
\langle C_1 :: C_2, v\rangle_{cont_2} &\Rightarrow \langle C_1, v, C_2\rangle_{cont_1} \\
\langle \text{nil,} v\rangle_{cont_2} &\Rightarrow \langle \text{nil,} v\rangle_{cont_2} \\
\end{align*}
\]

Fig. 1. A definitional abstract machine for shift and reset.

context and proceeds with an empty context. When applying a captured context, the machine concatenates the captured context to the current context and proceeds with the resulting context.

**Definition 2**
The partial evaluation function \( eval_{\text{cp}} \) mapping programs to values is defined as follows:

\( eval_{\text{cp}} \( e \) = v \) if and only if \( \langle e, \rho_{nc}, \text{END,} \text{nil}\rangle_{eval} \Rightarrow \langle \text{nil,} v\rangle_{cont_2} \).
- Terms and identifiers: \( e ::= \langle n \rangle \mid i \mid \lambda x.e \mid e_0.e_1 \mid \text{succ } e \mid \# e \mid Fk.e \)
- Values (integers, closures, and captured contexts): \( v ::= n \mid \{x, e, \rho \} \mid C_1 \)
- Environments: \( \rho ::= \rho_{\text{val}} \mid \rho_{\{i \mapsto v\}} \)
- Contexts: \( C_1 ::= \text{END} \mid \text{ARG}(\langle e, \rho \rangle, C_1) \mid \text{FUN}(v, C_1) \mid \text{SUCC}(C_1) \)
- Concatenation of contexts:
  \[
  \begin{align*}
  \text{END} \cdot C'_1 & \overset{\text{def}}{=} C'_1 \\
  (\text{ARG}(\langle e, \rho \rangle, C_1)) \cdot C'_1 & \overset{\text{def}}{=} \text{ARG}(\langle e, \rho \rangle, C_1 \cdot C'_1) \\
  (\text{FUN}(v, C_1)) \cdot C'_1 & \overset{\text{def}}{=} \text{FUN}(v, C_1 \cdot C'_1) \\
  (\text{SUCC}(C_1)) \cdot C'_1 & \overset{\text{def}}{=} \text{SUCC}(C_1 \cdot C'_1)
  \end{align*}
  \]
- Meta-contexts: \( C_2 ::= \text{nil} \mid C_1 :: C_2 \)
- Initial transition, transition rules, and final transition:

\[
\begin{align*}
\langle e, \rho_{\text{val}}, \text{END}, \text{nil} \rangle_{\text{eval}} & \\
\langle \langle n \rangle, \rho, C_1, C_2 \rangle_{\text{eval}} & \Rightarrow_{\text{cp}} \langle C_1, n, C_2 \rangle_{\text{cont}_1} \\
\langle i, \rho, C_1, C_2 \rangle_{\text{eval}} & \Rightarrow_{\text{cp}} \langle C_1, \rho(i), C_2 \rangle_{\text{cont}_1} \\
\langle \lambda x.e, \rho, C_1, C_2 \rangle_{\text{eval}} & \Rightarrow_{\text{cp}} \langle C_1, \{x, e, \rho\}, C_2 \rangle_{\text{cont}_1} \\
\langle e_0.e_1, \rho, C_1, C_2 \rangle_{\text{eval}} & \Rightarrow_{\text{cp}} \langle e_0, \rho, \text{ARG}(\langle e_1, \rho \rangle, C_1), C_2 \rangle_{\text{eval}} \\
\langle \text{succ } e, \rho, C_1, C_2 \rangle_{\text{eval}} & \Rightarrow_{\text{cp}} \langle e, \rho, \text{SUCC}(C_1), C_2 \rangle_{\text{eval}} \\
\langle \# e, \rho, C_1, C_2 \rangle_{\text{eval}} & \Rightarrow_{\text{cp}} \langle e, \rho, \text{END}, C_1 :: C_2 \rangle_{\text{eval}} \\
\langle Fk.e, \rho, C_1, C_2 \rangle_{\text{eval}} & \Rightarrow_{\text{cp}} \langle e, \rho(k \mapsto C_1), \text{END}, C_2 \rangle_{\text{eval}}
\end{align*}
\]

\[
\begin{align*}
\langle \text{END}, v, C_2 \rangle_{\text{cont}_1} & \Rightarrow_{\text{cp}} \langle C_2, v \rangle_{\text{cont}_1} \\
\langle \text{ARG}(\langle e, \rho \rangle, C_1), v, C_2 \rangle_{\text{cont}_1} & \Rightarrow_{\text{cp}} \langle e, \rho, \text{FUN}(v, C_1), C_2 \rangle_{\text{eval}} \\
\langle \text{FUN}(\langle x, e, \rho \rangle, C_1), v, C_2 \rangle_{\text{cont}_1} & \Rightarrow_{\text{cp}} \langle e, \rho(x \mapsto v), C_1, C_2 \rangle_{\text{eval}} \\
\langle \text{FUN}(C'_1, C_1), v, C_2 \rangle_{\text{cont}_1} & \Rightarrow_{\text{cp}} \langle C'_1 \cdot C_1, v, C_2 \rangle_{\text{cont}_1} \\
\langle \text{SUCC}(C_1), n, C_2 \rangle_{\text{cont}_1} & \Rightarrow_{\text{cp}} \langle C_1, n + 1, C_2 \rangle_{\text{cont}_1}
\end{align*}
\]

\[
\begin{align*}
\langle C_1 :: C_2, v \rangle_{\text{cont}_1} & \Rightarrow_{\text{cp}} \langle C_1, v, C_2 \rangle_{\text{cont}_1} \\
\langle \text{nil}, v \rangle_{\text{cont}_1} & \Rightarrow_{\text{cp}} v
\end{align*}
\]

Fig. 2. A definitional abstract machine for control and prompt
2.3 Static vs. dynamic delimited continuations

In Figure 1, shift and reset are said to be static because the application of a delimited continuation (represented as a captured context) does not depend on the current context. It is implemented by pushing the current context on the stack of contexts and installing the captured context as the new current context, as shown by the following transition:

\[ \langle \text{FUN} (C'_1, C_1), v, C_2 \rangle_{\text{cont}} \xrightarrow{sr} \langle C'_1, v, C_1 :: C_2 \rangle_{\text{cont}} \]

A subsequent shift operation will therefore capture the remainder of the reinstated context, statically.

In Figure 2, control and prompt are said to be dynamic because the application of a delimited continuation (also represented as a captured context) depends on the current context. It is implemented by concatenating the captured context to the current context, as shown by the following transition:

\[ \langle \text{FUN} (C'_1, C_1), v, C_2 \rangle_{\text{cont}} \xrightarrow{cp} \langle C'_1 \bullet C_1, v, C_2 \rangle_{\text{cont}} \]

A subsequent control operation will therefore capture the remainder of the reinstated context together with the then-current context, dynamically.

The two abstract machines differ only in this single transition. Because of this single transition, programs using shift and reset are compatible with the traditional notion of continuation-passing style (Biernacka et al., 2005; Danvy & Filinski, 1990; Plotkin, 1975) whereas programs using control and prompt give rise to a more complex notion of continuation-passing style that threads a dynamic state (Biernacki et al., 2005; Dybvig et al., 2005; Shan, 2004). This difference in the semantics of shift and control also induces distinct computational behaviors, as illustrated in the following example.

Copying vs. reversing a list: Using call-with-current-delimited-continuation (instead of shift or control) and delimit-continuation (instead of reset or prompt), let us consider the following function that traverses a given list and returns another list (Biernacka et al., 2005, Sec. 4.5); this function is written in the syntax of Scheme (Kelsey et al., 1998):

```scheme
(define traverse
  (lambda (xs)
    (letrec ((visit
               (lambda (xs)
                 (if (null? xs)
                     '()
                     (visit (call-with-current-delimited-continuation
                                 (lambda (k)
                                   (cons (car xs) (k (cdr xs)))))))))
      (delimit-continuation
       (lambda ()
         (visit xs))))))
```

- The function copies its input list if shift and reset are used instead of call-with-current-delimited-continuation and delimit-continuation. The reason why is that reinstating a shift-abstracted context keeps it distinct from the current context. Here, shift successively abstracts a delimited context that solely consists of the call to visit. Intuitively, this delimited context reads as follows:
\begin{verbatim}
(lambda (v)
  (delimit-continuation
   (lambda ()
     (visit v))))
\end{verbatim}

- The function \texttt{reverses} its input list if \texttt{control} and \texttt{prompt} are used instead of \texttt{call-with-current-delimited-continuation} and \texttt{delimit-continuation}. The reason why is that reinstating a \texttt{control}-abstracted context grafts it to the current context. Here, \texttt{control} successively abstracts a context that consists of the call to \texttt{visit} followed by the construction of a reversed prefix of the input list. Intuitively, when the input list is \texttt{(1 2 3)}, the successive contexts read as follows:

\begin{verbatim}
(lambda (v) (visit v))
(lambda (v) (cons 1 (visit v))
(lambda (v) (cons 2 (cons 1 (visit v))))
\end{verbatim}

\textbf{Programming folklore:} To obtain the effect of \texttt{shift} and \texttt{reset} using \texttt{control} and \texttt{prompt}, one should replace every occurrence of a shift-bound variable \texttt{k} by its \texttt{η}-expanded and delimited version \(\lambda x.\#(k \ x)\). (As a \(\beta\)-optimization, every application of \texttt{k} to a trivial expression \(e\) (typically a value) can be replaced by \(\#(k \ e)\).)

And indeed, replacing

\begin{verbatim}
(cons (car xs) (k (cdr xs)))
\end{verbatim}

by

\begin{verbatim}
(cons (car xs) (delimit-continuation
  (lambda ()
    (k (cdr xs)))))
\end{verbatim}

in the definition of \texttt{traverse} above makes it copy its input list, no matter whether \texttt{shift} and \texttt{reset} or \texttt{control} and \texttt{prompt} are used.

We formalize the replacement above with the following compositional translation from the language with \texttt{shift} and \texttt{reset} to the language with \texttt{control} and \texttt{prompt}.

\textbf{Definition 3}

The translation \(\llbracket \cdot \rrbracket\) is defined as follows:

\[
\begin{align*}
\llbracket n \rrbracket & = \overline{n} \\
\llbracket x \rrbracket & = x \\
\llbracket k \rrbracket & = \lambda x.\#(k \ x), \text{ where } x \text{ is fresh} \\
\llbracket \lambda x.e \rrbracket & = \lambda x.[e] \\
\llbracket e_0 \ e_1 \rrbracket & = [e_0] [e_1] \\
\llbracket e \rrbracket & = \#[e] \\
\llbracket S k.e \rrbracket & = Fk.[e]
\end{align*}
\]

In the next section, we prove that for any program \(e\), \(eval_s(e)\) and \(eval_{cp}(\llbracket e \rrbracket)\) are equivalent (in the sense of Definition 5 below) and, in particular, equal for ground values.
3 The folklore theorem and its formal proof

We first define an auxiliary abstract machine for \texttt{control} and \texttt{prompt} that implements the application of an \eta-expanded and delimited continuation in one step. By construction, this auxiliary abstract machine is equivalent to the definitional one of Figure 2. We then show that the auxiliary machine operates in lock step with the definitional abstract machine of Figure 1. To this end, we define a family of relations between the abstract machine for \texttt{shift} and \texttt{reset} and the auxiliary abstract machine. The folklore theorem follows.

3.1 An auxiliary abstract machine for \texttt{control} and \texttt{prompt}

\textbf{Definition 4}

The auxiliary abstract machine for \texttt{control} and \texttt{prompt} is defined as follows:

1. All the components, including configurations \( \delta \), of the auxiliary abstract machine are identical to the components of the definitional abstract machine of Figure 2.
2. The transitions of the auxiliary abstract machine, denoted \( \delta \Rightarrow_{\text{aux}} \delta' \), are defined as follows:
   - if \( \delta = \langle \text{FUN}([x, \#(k \cdot x), C_1], v, C_2)_{\text{cont}} \rangle \) then \( \delta' = \langle C'_1, v, C_1 :: C_2\rangle_{\text{cont}} \) where \( C'_1 = \rho(k) \);
   - otherwise, \( \delta' \) is the configuration such that \( \delta \Rightarrow_{\text{cp}} \delta' \), if it exists.
3. The partial evaluation function \( \text{eval}_{\text{aux}} \) is defined in the usual way: \( \text{eval}_{\text{aux}}(e) = v \) if and only if \( \langle e, \rho_{\text{mt}}, \text{END}, \text{nil} \rangle_{\text{eval}} \Rightarrow_{\text{aux}}^+ \langle \text{nil}, v \rangle_{\text{cont}} \).

The following lemma shows that the definitional abstract machine for \texttt{control} and \texttt{prompt} simulates the single step of the auxiliary abstract machine in several steps.

\textbf{Lemma 1}

For all \( v, C_1, C'_1 \) and \( C_2 \),

\[
\langle \text{FUN}([x, \#(k \cdot x), C_1], v, C_2)_{\text{cont}} \rangle \Rightarrow_{\text{cp}}^+ \langle C'_1, v, C_1 :: C_2\rangle_{\text{cont}} \text{, where } C'_1 = \rho(k)\text{.}
\]

\textbf{Proof}

From the definition of the abstract machine for \texttt{control} and \texttt{prompt} in Figure 2:

\[
\langle \text{FUN}([x, \#(k \cdot x), C_1], v, C_2)_{\text{cont}} \rangle \Rightarrow_{\text{cp}} \langle \#(k \cdot x), \rho(x \mapsto v), C_1, C_2\rangle_{\text{eval}} \Rightarrow_{\text{cp}} \langle k, x, \rho(x \mapsto v), \text{END}, C_1 :: C_2\rangle_{\text{eval}} \Rightarrow_{\text{cp}} \langle x, \rho(x \mapsto v), \text{ARG}((x, \rho(x \mapsto v)), \text{END}), C_1 :: C_2\rangle_{\text{eval}} \Rightarrow_{\text{cp}} \langle \text{ARG}((x, \rho(x \mapsto v)), \text{END}), C'_1, C_1 :: C_2\rangle_{\text{cont}} \Rightarrow_{\text{cp}} \langle x, \rho(x \mapsto v), \text{FUN}(C'_1, \text{END}), C_1 :: C_2\rangle_{\text{eval}} \Rightarrow_{\text{cp}} \langle \text{FUN}(C'_1, \text{END}), v, C_1 :: C_2\rangle_{\text{cont}} \Rightarrow_{\text{cp}} \langle C'_1, v, C_1 :: C_2\rangle_{\text{cont}} \Rightarrow_{\text{cp}} \langle C'_1, v, C_1 :: C_2\rangle_{\text{cont}} \text{.}
\]

\textbf{Proposition 1}

For any program \( e \) and for any value \( v \), \( \text{eval}_{\text{cp}}(e) = v \) if and only if \( \text{eval}_{\text{aux}}(e) = v \).

\textbf{Proof}

Follows directly from Definition 4 and Lemma 1.
3.2 A family of relations

We now define a family of relations between the abstract machine for \( \text{shift} \) and \( \text{reset} \) and the auxiliary abstract machine for \( \text{control} \) and \( \text{prompt} \). To distinguish between the two machines, as a diacritical convention (Milne \& Strachey, 1976), we annotate the components of the machine for \( \text{shift} \) and \( \text{reset} \) with a hat.

**Definition 5**

The relations between the components of the abstract machine for \( \text{shift} \) and \( \text{reset} \) and the auxiliary abstract machine for \( \text{control} \) and \( \text{prompt} \) are defined as follows:

1. **Terms:** \( \hat{\hat{\varepsilon}} \simeq_e \varepsilon \) iff \( \hat{\varepsilon} = e \)
2. **Values:**
   (a) \( \hat{n} \simeq_v n \) iff \( \hat{n} = n \)
   (b) \( \hat{x}, \hat{\varepsilon}, \hat{\rho} \simeq_v [x, \varepsilon, \rho] \) iff \( \hat{x} = x \), \( \hat{\varepsilon} \simeq_e \varepsilon \) and \( \hat{\rho} \simeq_{\text{env}} \rho \)
   (c) \( \hat{C}_1 \simeq_v [x, \#(k, x), \rho] \) iff \( \hat{C}_1 \simeq_e \rho(k) \)
3. **Environments:**
   (a) \( \hat{\rho}_{\text{nt}} \simeq_{\text{env}} \rho_{\text{nt}} \)
   (b) \( \hat{\rho}(x \mapsto \hat{\varepsilon}) \simeq_{\text{env}} \rho(x \mapsto v) \) iff \( \hat{\varepsilon} \simeq_v v \) and \( \hat{\rho} \simeq_{\text{env}} \rho \setminus \{x\} \), where \( \rho \setminus \{i\} \) denotes the restriction of \( \rho \) to its domain excluding \( i \)
   (c) \( \hat{\rho}(k \mapsto \hat{C}_1) \simeq_{\text{env}} \rho(k \mapsto C_1) \) iff \( \hat{C}_1 \simeq_e C_1 \) and \( \hat{\rho} \setminus \{k\} \simeq_{\text{env}} \rho \setminus \{k\} \)
4. **Contexts:**
   (a) \( \hat{\text{END}} \simeq_e \text{END} \)
   (b) \( \hat{\text{ARG}}((\hat{\varepsilon}, \hat{\rho}), \hat{C}_1) \simeq_e \text{ARG}((\varepsilon, \rho), C_1) \) iff \( \hat{\varepsilon} \simeq_e \varepsilon \), \( \hat{\rho} \simeq_{\text{env}} \rho \), and \( \hat{C}_1 \simeq_e C_1 \)
   (c) \( \hat{\text{FUN}}(\hat{\varepsilon}, \hat{C}_1) \simeq_e \text{FUN}(\varepsilon, C_1) \) iff \( \hat{\varepsilon} \simeq_v \varepsilon \) and \( \hat{C}_1 \simeq_e C_1 \)
   (d) \( \hat{\text{SUCC}}(\hat{C}_1) \simeq_e \text{SUCC}(C_1) \) iff \( \hat{C}_1 \simeq_e C_1 \)
5. **Meta-contexts:**
   (a) \( \hat{\text{nil}} \simeq_{\text{mc}} \text{nil} \)
   (b) \( \hat{C}_1 :: \hat{C}_2 \simeq_{\text{mc}} C_1 :: C_2 \) iff \( \hat{C}_1 \simeq_e C_1 \) and \( \hat{C}_2 \simeq_{\text{mc}} C_2 \)
6. **Configurations:**
   (a) \( \hat{\langle} \hat{\varepsilon}, \hat{\rho}, \hat{C}_1, \hat{C}_2 \rangle_{\text{eval}} \simeq \langle \varepsilon, \rho, C_1, C_2 \rangle_{\text{eval}} \) iff
      \( \hat{\varepsilon} \simeq_e \varepsilon \), \( \hat{\rho} \simeq_{\text{env}} \rho \), \( \hat{C}_1 \simeq_e C_1 \), and \( \hat{C}_2 \simeq_{\text{mc}} C_2 \)
   (b) \( \hat{\langle} \hat{C}_1, \hat{\nu}, \hat{C}_2 \rangle_{\text{cont}} \simeq \langle C_1, \nu, C_2 \rangle_{\text{cont}} \) iff
      \( \hat{C}_1 \simeq_e C_1 \), \( \hat{\nu} \simeq_v \nu \), and \( \hat{C}_2 \simeq_{\text{mc}} C_2 \)
   (c) \( \hat{\langle} \hat{C}_2, \hat{\nu} \rangle_{\text{cont}} \simeq \langle C_2, \nu \rangle_{\text{cont}} \) iff
      \( \hat{C}_2 \simeq_{\text{mc}} C_2 \) and \( \hat{\nu} \simeq_v \nu \)

The relations are intended to capture the equivalence of the abstract machine for \( \text{shift} \) and \( \text{reset} \) and the auxiliary abstract machine for \( \text{control} \) and \( \text{prompt} \) when run on a term \( \hat{\varepsilon} \) and on its translation \( \hat{\varepsilon} \), respectively. Most of the cases are homomorphic on the structure of a component. The critical cases are: (1)—a formalization of the programming folklore formulated in Section 2.3, and (2)(c)—a formalization of the fact that a \( \text{control} \)-absted continuation is applied by concatenating its representation to the current context whereas when a \( \text{shift} \)-absted continuation is applied, its representation is kept separate from the current context.
To this end we need to prove the following lemmas.

**Lemma 2**
For all configurations $\hat{\delta}, \delta, \hat{\delta}'$ and $\delta'$, if $\hat{\delta} \simeq \delta$ then

$$\hat{\delta} \Ra\text{sr} \hat{\delta}' \text{ if and only if } \delta \Ra\text{aux} \delta' \text{ and } \hat{\delta}' \simeq \delta'.$$

**Proof**
By case inspection of $\hat{\delta} \simeq \delta$. All cases follow directly from the definition of the relation $\simeq$ and the definitions of the abstract machines. We present two crucial cases:

**Case:** $\hat{\delta} = \langle k, \hat{\rho}, C_1, C_2 \rangle_{\text{eval}}$ and $\delta = \langle \lambda x. \#(k x), \rho, C_1, C_2 \rangle_{\text{eval}}$

From the definition of the abstract machine for shift and reset, $\hat{\delta} \Ra\text{sr} \hat{\delta}'$, where $\hat{\delta}' = (\hat{C}_1, \hat{\rho}(k), \hat{C}_2)_{\text{cont}}$

From the definition of the auxiliary abstract machine for control and prompt, $\delta \Ra\text{aux} \delta'$, where $\delta' = (C_1, [x, \#(k x), \rho], C_2)_{\text{cont}}$

By assumption, $\hat{\rho}(k) \simeq C_1$ and $C_2 \simeq C_2$. Hence, $\hat{\delta}' \simeq \delta'$.

**Case:** $\hat{\delta} = \langle \text{FUN} (\hat{C}_1', \hat{C}_1), \hat{v}, \hat{C}_2 \rangle_{\text{eval}}$ and $\delta = \langle \text{FUN} ([x, \#(k x), \rho], C_1), v, C_2 \rangle_{\text{eval}}$

From the definition of the abstract machine for shift and reset, $\hat{\delta} \Ra\text{sr} \hat{\delta}'$, where $\hat{\delta}' = (\hat{C}_1', \hat{v}, \hat{C}_1 :: \hat{C}_2)_{\text{cont}}$

From the definition of the auxiliary abstract machine for control and prompt, $\delta \Ra\text{aux} \delta'$, where $\delta' = (C_1', v, C_1 :: C_2)_{\text{cont}}$, and $\rho(k)$.

By assumption, $\hat{C}_1 \simeq C_1$, $\hat{v} \simeq v$, $\hat{C}_1 \simeq C_1$ and $\hat{C}_2 \simeq C_2$. Hence, $\hat{\delta}' \simeq \delta'$.

**Lemma 3**
For all configurations $\hat{\delta}, \delta, \hat{\delta}'$ and $\delta'$, and for any $n \geq 1$, if $\hat{\delta} \simeq \delta$ then

$$\hat{\delta} \Ra\text{sr}^n \hat{\delta}' \text{ if and only if } \delta \Ra\text{aux}^n \delta' \text{ and } \hat{\delta}' \simeq \delta'.$$
Proof
By induction on $n$, using Lemma 2.

We are now in position to prove the formal statement of the equivalence between the two abstract machines:

**Proposition 2**
For any program $\tilde{e}$, either both $eval_{sr}(\tilde{e})$ and $eval_{aux}([\tilde{e}])$ are undefined or there exist values $\hat{v}$ and $v$ such that $eval_{sr}(\tilde{e}) = \hat{v}$, $eval_{aux}([\tilde{e}]) = v$, and $\hat{v} \simeq v$.

**Proof**
Since the initial configurations $\langle \tilde{e}, p_{mt}, END, \tilde{v} \rangle_{eval}$ and $\langle [\tilde{e}], p_{mt}, END, \tilde{v} \rangle_{eval}$ are in the relation $\simeq$, then by Lemma 3 both abstract machines reach their final configurations $\langle \tilde{v}, \tilde{v} \rangle_{conts}$ and $\langle \tilde{v}, \tilde{v} \rangle_{conts}$ after the same number of transitions and with $\hat{v} \simeq v$, or both diverge.

**Theorem 1**
For any program $\tilde{e}$, either both $eval_{sr}(\tilde{e})$ and $eval_{cp}([\tilde{e}])$ are undefined or there exist values $\hat{v}$ and $v$ such that $eval_{sr}(\tilde{e}) = \hat{v}$, $eval_{cp}([\tilde{e}]) = v$, and $\hat{v} \simeq v$.

**Proof**
Follows directly from Proposition 1 and Proposition 2.

**Corollary 1** (Folklore)
For any program $\tilde{e}$, and for any integer $n$, $eval_{sr}(\tilde{e}) = n$ if and only if $eval_{cp}([\tilde{e}]) = n$.

Extending the source language with more syntactic constructs (other ground values and primitive operations, conditional expressions, recursive definitions, etc.) is straightforward. It is equally simple to extend the proof.

Our simple proof is based on the original (operational) specification of static and dynamic delimited continuations. An alternative proof could be based, e.g., on equational reasoning (Felleisen, 1988; Kameyama & Hasegawa, 2003).

## 4 Conclusion
We have formalized and proved that the dynamic delimited-control operators $control$ and $prompt$ can simulate the static delimited-control operators $shift$ and $reset$ by delimiting the context of the resumption of captured continuations. Several converse simulations have been presented recently (Shan, 2004; Biernacki et al., 2005; Kiselyov, 2005). These converse simulations are considerably more involved than the present one, and have not been formalized and proved yet.
